### Domain decomposition-type methods

- Introduction motivation
- Domain partitioning and distributed sparse matrices
- Basic algorithms: distributed Matvec
- Distributed preconditoners: additive Schwarz, multiplicatieve Schwarz.
- Schur complement techniques
- Graph partitioniong

### Introduction

- Thrust of parallel computing techniques in most applications areas.
- Programming model: Message-passing seems (MPI) dominates
- ➤ Open MP and threads for small number of processors
- ➤ Important new reality: parallel programming has penetrated the 'applications' areas [Sciences and Engineering + industry]
- Problem 1: algorithms lagging behind somewhat
- ➤ Problem 2: Message passing is painful for large applications. 'Time to solution' is high.

18-2 \_\_\_\_\_ Csci 8314 – April 24, 2014

# Domain Decomposition: A Model problem

# **Problem:**

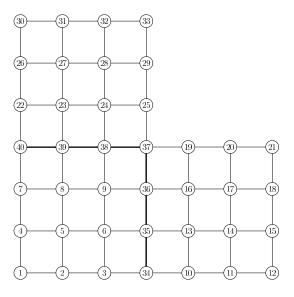

$$\left\{egin{array}{ll} \Delta u = f ext{ in } \Omega \ u = u_{\Gamma} ext{ on } \Gamma = \partial \Omega. \end{array}
ight.$$

# $\Omega_3$ $\Gamma_{13}$ $\Gamma_{12}$ $\Omega_2$

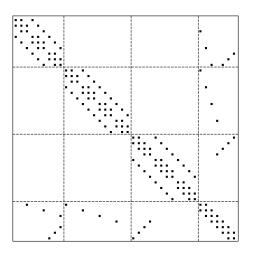

### Domain:

$$\Omega = igcup_{i=1}^s \Omega_i,$$

ightharpoonup Domain decomposition or substructuring methods attempt to solve a PDE problem (e.g.) on the entire domain from problem solutions on the subdomains  $\Omega_i$ .

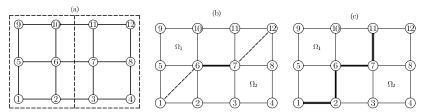

Discretization of domain

Coefficient Matrix

Types of mappings

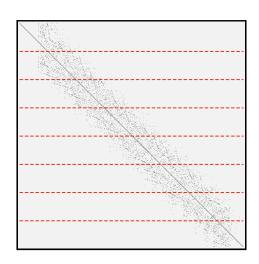

- (a) Vertex-based; partitioning
- (b) edge-based; and
- (c) element-based
- Can adapt PDE viewpoint to general sparse matrices.
- ➤ Will use the graph representation and 'vertex-based' viewpoint —

8-6 \_\_\_\_\_ Csci 8314 – April 24, 2014

# $Generalization:\ Distributed\ Sparse\ Systems$

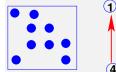

- Simple illustration: Block assignment. Assign equation *i* and unknown *i* to a given 'process'
- Naive partitioning won't work well in practice

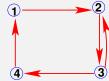

Csci 8314 - April 24, 2014

 $\blacktriangleright$  Best idea is to use the adjacency graph of A:

 $\begin{array}{l} \mathsf{Vertices} = \{1, 2, \cdots, n\}; \\ \mathsf{Edges:} \ i \to j \ \mathsf{iff} \ a_{ij} \neq 0 \end{array}$ 

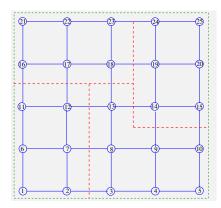

# Graph partitioning problem:

- Want a partition of the vertices of the graph so that
- (1) partitions have  $\sim$  the same sizes
- (2) interfaces are small in size

18-7 \_\_\_\_\_ Csci 8314 – April 24, 2014

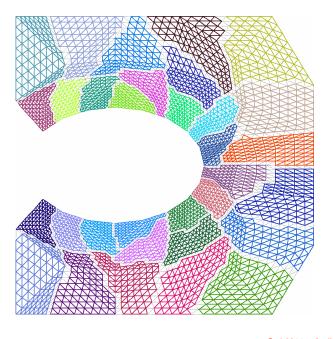

# General Partitioning of a sparse linear system

 $S_1=\{1,2,6,7,11,12\}$ : This means equations and unknowns 1, 2, 3, 6, 7, 11, 12 are assigned to Domain 1.

$$S_2 = \{3, 4, 5, 8, 9, 10, 13\}$$
  
 $S_3 = \{16, 17, 18, 21, 22, 23\}$   
 $S_4 = \{14, 15, 19, 20, 24, 25\}$ 

8-9 Csci 8314 – April 24, 2014

Alternative: Map elements / edges rather than vertices

Equations/unknowns 3, 8, 12 shared by 2 domains. From distributed sparse matrix viewpoint this is an overlap of one layer

- ➤ Partitioners : Metis, Chaco, Scotch, ..
- ➤ More recent: Zoltan, H-Metis, PaToH

8-10 \_\_\_\_\_ Csci 8314 – April 24, 2014

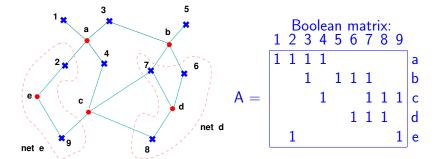

- ➤ Standard dual objective: "minimize" communication + "balance" partition sizes
- ➤ Recent trend: use of hypergraphs [PaToh, Hmetis,...]

Csci 8314 – April 24, 2014

# A few words about hypergraphs

- ➤ Hypergraphs are very general.. Ideas borrowed from VLSI work
- Main motivation: to better represent communication volumes when partitioning a graph. Standard models face many limitations
- ➤ Hypergraphs can better express complex graph partitioning problems and provide better solutions.
- Example: completely nonsymmetric patterns ...
- .. Even rectangular matrices

**Example:**  $V = \{1, \dots, 9\}$  and  $E = \{a, \dots, e\}$  with  $a = \{1, 2, 3, 4\}$ ,  $b = \{3, 5, 6, 7\}$ ,  $c = \{4, 7, 8, 9\}$ ,  $d = \{6, 7, 8\}$ , and  $e = \{2, 9\}$ 

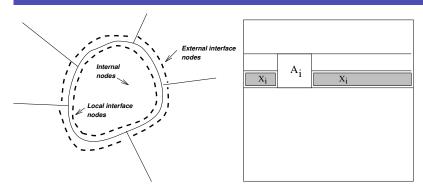

Csci 8314 - April 24, 2014

18-13 \_\_\_\_\_ Csci 8314 - April 24, 2014 18-14 \_\_\_\_\_

# Distributed Sparse matrices (continued)

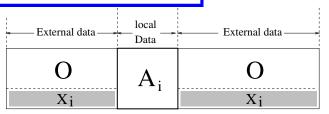

- Once a good partitioning is found, questions are:
- 1. How to represent this partitioning?
- 2. What is a good data structure for representing distributed sparse matrices?
- 3. How to set up the various "local objects" (matrices, vectors, ..)
- 4. What can be done to prepare for communication that will be required during execution?

# Two views of a distributed sparse matrix

- Local interface variables always ordered last.
- Need: 1) to set up the various "local objects". 2) Preprocessing to prepare for communications needed during iteration?

### **Local view of distributed matrix:**

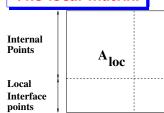

# The local system:

$$\underbrace{\begin{pmatrix} B_i \; F_i \\ E_i \; C_i \end{pmatrix}}_{A_i} \begin{pmatrix} u_i \\ y_i \end{pmatrix} + \underbrace{\begin{pmatrix} 0 \\ \sum_{j \in N_i} E_{ij} y_j \end{pmatrix}}_{y_{ext}} = \begin{pmatrix} f_i \\ g_i \end{pmatrix}$$

 $\triangleright u_i$ : Internal variables;  $y_i$ : Interface variables

8-17 Csci 8314 – April 24, 2014

### The local matrix:

The local matrix consists of 2 parts: a part  $(A_{loc})$  which acts on local data and another  $(B_{ext})$  which acts on remote data.

- ➤ Once the partitioning is available these parts must be identified and built locally..
- In finite elements, assembly is a local process.
- ➤ How to perform a matrix vector product? [needed by iterative schemes?]

18 \_\_\_\_\_ Csci 8314 – April 24, 2014

# Distributed Sparse Matrix-Vector Product Kernel

### Algorithm:

1. Communicate: exchange boundary data.

Scatter  $x_{bound}$  to neighbors - Gather  $x_{ext}$  from neighbors

2. Local matrix – vector product

$$y = A_{loc} x_{loc}$$

3. External matrix – vector product

$$y = y + B_{ext} x_{ext}$$

NOTE: 1 and 2 are independent and can be overlapped.

# $Distributed\ Sparse\ Matrix-Vector\ Product$

### Main part of the code:

```
call MSG_bdx_send(nloc,x,y,nproc,proc,ix,ipr,ptrn,ier

do local matrix-vector product for local points
    call amux(nloc,x,y,aloc,jaloc,ialoc)

receive the boundary information
    call MSG_bdx_receive(nloc,x,y,nproc,proc,ix,ipr,ptrn,

do local matrix-vector product for external points
    nrow = nloc - nbnd + 1
    call amux1(nrow,x,y(nbnd),aloc,jaloc,ialoc(nloc+1))
    return
```

19 \_\_\_\_\_ Csci 8314 – April 24, 2014

# The local exchange information

- List of adjacent processors (or subdomains)
- For each of these processors, lists of boundary nodes to be sent / received to /from adj. PE's.
- ➤ The receiving processor must have a matrix ordered consistently with the order in which data is received.

# Requirements

- ➤ The 'set-up' routines should handle overlapping
- Should use minimal storage (only arrays of size nloc allowed).

Csci 8314 - April 24, 2014

1. Start: Choose  $x_0$  and m. Let of the Krylov subspaces. Define  $ar{H}_m~\in~\mathbb{R}^{(m+1) imes m}$  with  $ar{H}_m\equiv 0$ . and initialize all its entries  $h_{i,i}$  to zero.

Distributed Flexible GMRES (FGMRES)

2. Arnoldi process:

(a) Compute  $r_0=b-Ax_0,\, eta=\|r_0\|_2$  and  $v_1=r_0/eta$ .

(b) For j = 1, ..., m do

ullet Compute  $egin{aligned} z_j := M_j^{-1} v_j \end{aligned}$ ; Compute  $egin{aligned} w := A z_j \end{aligned}$ ; ullet For  $i=1,\ldots,j$ , do 1.  $h_{i,j} := (w,v_i)$  2. w:=

 $w-h_{i,j}v_iigg\{egin{aligned} h_{i,j} &:= (w,v_i)\ w &:= w-h_{i,j}v_i \end{aligned}$ 

ullet Compute  $h_{i+1,j}=\|w\|_2$  and  $v_{i+1}=w/h_{i+1,j}$ .

(c) Define  $Z_m:=[z_1,....,z_m]$ 

3. Form the approximate solution: Compute  $\|y_m = \mathop{
m argmin}
olimits_n \|eta e_1 - ar{H}_m y\|_2$  and  $x_m = x_0 + [z_1, z_2, ..., z_m] y_m$ 

and  $e_1 = [1, 0, \dots, 0]^T$ . with  $\bar{H}_m = \{h_{i,i}\}_{1 \leq i \leq j+1; 1 \leq j \leq m}$ .

4. Restart: If satisfied stop, else set  $x_0 \leftarrow x_m$  and goto 1.

# Main Operations in (F) GMRES:

- 1. Saxpy's local operation no communication
- 2. Dot products global operation
- 3. Matrix-vector products local operation local communication
- 4. Preconditioning operations locality varies.

### Distributed Dot Product

```
/*----- call blas1 function
  tloc = DDOT(n, x, incx, y, incy);
/*----- call global reduction
  MPI_Allreduce(&tloc,&ro,1,MPI_DOUBLE,MPI_SUM,comm);
```

### A remark: the global viewpoint

Csci 8314 - April 24, 2014

Csci 8314 - April 24, 2014

### DISTRIBUTED PRECONDITIONERS

### Example: Distributed ILU(0)

➤ Global view of matrix is (for 4 processors):

$$A = egin{pmatrix} A_1 & & |F_1| \ A_2 & & |F_2| \ A_3 & |F_3| \ & & |A_4| |F_4| \ \hline E_1 & E_2 & E_3 & E_4 & |D| \end{pmatrix}$$

- $ightharpoonup A_i = ext{local matrix restricted to internal nodes only.}$
- ➤ 1-st approach: Idea: ILU on this matrix parallelism available for diagonal blocks. Define an order in which to eliminate interface unknowns.

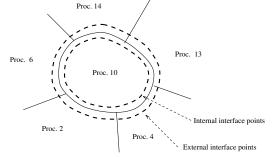

- ightharpoonup 2-nd approach: Multi-color, k-step SOR or SSOR preconditioners.
- ➤ 3-rd approach: Solve equations for all interface points [Schur Complement approach] to precondition, use ideas from DD.

Csci 8314 - April 24, 2014

# Example: Distributed ILU(0) – cont.

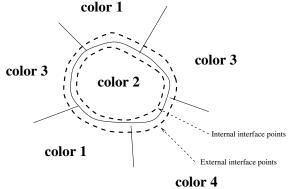

- Easy to understand from a local view of distributed matrix
- > Start by selecting an order [or a "schedule", or a "priority rule"] in which to process globally
- ➤ Then locally:
  - 1. Eliminate internal rows
  - 2. Receive rows needed to process local interface rows
  - 3. Process local interface rows
  - 4. Send local interface rows to processors needing them

A distributed view of ILU(0) – schedule based on PE numbers

Note: any schedule can be used provided neighbors have different labels. Example: can use coloring.

A distributed view of ILU(0) – schedule based on PE coloring

- See [S. Ma and YS. 1994]
- ➤ Generalized ILU(k): D. Hysom and A. Pothen '00.
- Used in pARMS for preconditioning Schur complement

8-32 \_\_\_\_\_ Csci 8314 - April 24, 2014

# Domain Decomposition-Type preconditoners

- Schwarz Preconditioners
- Schur-complement based Preconditioners
- Multi-level ILU-type Preconditioners
- ➤ <u>Observation:</u> Often, in practical applications, Schwarz Preconditioners are used: SUB-OPTIMAL

8-33 \_\_\_\_\_\_ Csci 8314 – April 24, 2014

- ➤ Multiplicative Schwarz. Need a coloring of the subdomains so that:
- No two adjacent subdomains share same color

# Multicolor Block SOR Iteration (Multiplicative Schwarz):

- 1. Do  $col = 1, \ldots, num cols$
- 2. If (col.eq.mycol) Then
- 3. Obtain external data  $y_i$
- 4. Update local residual  $r_i = (b Ax)_i$
- 5. Solve  $A_i \delta_i = r_i$
- 6. Update solution  $x_i = x_i + \delta_i$
- 7. EndIf
- 8. EndDo

# Domain-Decomposition Preconditioners (cont.)

Local view of distributed matrix:

Block Jacobi Iteration (Additive Schwarz):

- 1. Obtain external data  $y_i$
- 2. Compute (update) local residual

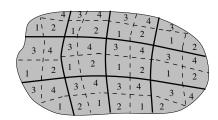

$$r_i = (b - Ax)_i = b_i - A_i x_i - B_i y_i$$

- 3. Solve  $A_i \delta_i = r_i$
- 4. Update solution  $x_i = x_i + \delta_i$

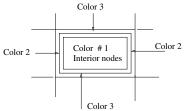

8-34 Csci 8314 – April 24, 2014

# $Breaking\ the\ sequential\ color\ loop$

- ➤ "Color" loop is sequential. Can be broken in several different ways.
- (1) Have a few subdomains per processors

(2) Separate interior nodes from interface nodes (2-level blocking)

(3) Use a block-GMRES algorithm - with Block-size = number of colors. SOR step targets a different color on each column of the block  $\triangleright$  no iddle time.

-37 \_\_\_\_\_ Csci 8314 – April 24, 2014

SCHUR COMPLEMENT-BASED PRECONDITIONERS

# Local Solves

- ightharpoonup Each local system  $A_i \delta_i = r_i$  can be solved in three ways:
- 1. By a (sparse) direct solver
- 2. Using a standard preconditioned Krylov solver
- 3. Doing a backward-forward solution associated with an accurate ILU (e.g. ILUT) precondioner
- ➤ We only use (2) with a small number of inner steps (up to 10) or (3).

18-38 \_\_\_\_\_ Csci 8314 – April 24, 2014

# $Schur\ complement\ system$

Local system can be written as

$$A_{i}x_{i} + X_{i}y_{i,ext} = b_{i}. \tag{1}$$

$$- \text{External data} - \text{Docal} - \text{External data} - \text{External$$

 $x_i$ = vector of local unknowns,  $y_{i,ext}$  = external interface variables, and  $b_i$  = local part of RHS.

➤ Local equations

$$\begin{pmatrix} B_i & F_i \\ E_i & C_i \end{pmatrix} \begin{pmatrix} u_i \\ y_i \end{pmatrix} + \begin{pmatrix} 0 \\ \sum_{j \in N_i} E_{ij} y_j \end{pmatrix} = \begin{pmatrix} f_i \\ g_i \end{pmatrix}$$
(2)

 $\triangleright$  eliminate  $u_i$  from the above system:

$$S_i y_i + \sum_{j \in N_i} E_{ij} y_j = g_i - E_i B_i^{-1} f_i \equiv g_i',$$

where  $S_i$  is the "local" Schur complement

$$S_i = C_i - E_i B_i^{-1} F_i. (3)$$

18-41 \_\_\_\_\_ Csci 8314 – April 24, 2014

### Structure of Schur complement system

Global Schur complement system:

Sy = g' with:

$$S = egin{pmatrix} S_1 & E_{12} & \dots & E_{1p} \ E_{21} & S_2 & \dots & E_{2p} \ dots & \ddots & dots \ E_{p1} & E_{p-1,2} & \dots & S_p \end{pmatrix} egin{pmatrix} y_1 \ y_2 \ dots \ y_p \end{pmatrix} \ = \ egin{pmatrix} g_1' \ g_2' \ dots \ g_p' \end{pmatrix}.$$

- $ightharpoonup E_{ij}$ 's are sparse = same as in the original matrix
- ➤ Can solve global Schur complement system iteratively. Back-substitute to recover rest of variables (internal).
- ➤ Can use the procedure as a preconditining to global system.

2 Csci 8314 – April 24, 2014

# $Simplest\ idea:\ Schur\ Complement\ Iterations$

 $\begin{pmatrix} u_i \\ y_i \end{pmatrix}$  Internal variables

- Do a global primary iteration (e.g., block-Jacobi)
- ightharpoonup Then accelerate only the y variables (with a Krylov method) Still need to precondition..

### Approximate Schur-LU

Two-level method based on induced preconditioner. Global system can also be viewed as

$$egin{pmatrix} \left(egin{array}{ccc} B & F \ E & C \end{array}
ight) \left(egin{array}{ccc} u \ y \end{array}
ight) = \left(egin{array}{ccc} f \ g \end{array}
ight) \;\;, \;\;\; B = \left(egin{array}{cccc} B_1 & & & |F_1 \ & B_2 & & |F_2 \ & & \ddots & & dots \ & & B_p & F_p \ \hline E_1 & E_2 & \cdots & E_p & C \end{array}
ight)$$

Block LU factorization of **A**:

$$\begin{pmatrix} B & F \\ E & C \end{pmatrix} = \begin{pmatrix} B & 0 \\ E & S \end{pmatrix} \; \begin{pmatrix} I & B^{-1}F \\ 0 & I \end{pmatrix},$$

# **Preconditioning:**

$$L = egin{pmatrix} B & 0 \ E & M_S \end{pmatrix}$$
 and  $U = egin{pmatrix} I & B^{-1}F \ 0 & I \end{pmatrix}$ 

with  $M_S=$  some approximation to S.

➤ Preconditioning to global system can be induced from any preconditioning on Schur complement.

Rewrite local Schur system as

$$y_i + S_i^{-1} \sum_{j \in N_i} E_{ij} y_j = S_i^{-1} \left[ g_i - E_i B_i^{-1} f_i 
ight].$$

- > equivalent to Block-Jacobi preconditioner for Schur complement.
- ➤ Solve with, e.g., a few s (e.g., 5) of GMRES

18-45 \_\_\_\_\_ Csci 8314 - April 24, 2014

**GRAPH PARTITIONING** 

- $\triangleright$  Question: How to solve with  $S_i$ ?
- lacksquare Can use LU factorization of local matrix  $A_i = egin{pmatrix} B_i & F_i \ E_i & C_i \end{pmatrix}$

and exploit the relation:

$$A_i = egin{pmatrix} L_{B_i} & 0 \ E_i U_{B_i}^{-1} & L_{S_i} \end{pmatrix} egin{pmatrix} U_{B_i} & L_{B_i}^{-1} F_i \ 0 & U_{S_i} \end{pmatrix} &
ightarrow & L_{S_i} U_{S_i} = S_i \end{pmatrix}$$

- ightharpoonup Need only the (I) LU factorization of the  $A_i$  [rest is already available]
- ➤ Very easy implementation of (parallel) Schur complement techniques for vertex-based partitioned systems : YS-Sosonkina '97; YS-Sosonkina-Zhang '99.

3-46 \_\_\_\_\_\_ Csci 8314 – April 24, 2014

# Three approaches to graph partitioning:

- 1. Spectral methods (Recursive Spectral Bisection)
- 2. Geometric techniques [Houstis & Rice et al., Miller, Vavasis, Teng et al.] Coordinates are required.
- 3. Graph Theory techniques [use graph, but no coordinates]
  - Currently best known technique is Metis (multi-level algorithm)
  - Simplest idea: Recursive Graph Bisection; Nested dissection (George & Liu, 1980; Liu 1992)
  - Advantages: simplicity no coordinates required

# Background: Graph Laplaceans

- ➤ "Laplace-type" matrices associated with general undirected graphs
   useful in many applications
- ightharpoonup Given a graph G=(V,E) define
- ullet A matrix W of weights  $w_{ij}$  for each edge
- ullet Assume  $w_{ij} \geq 0$ ,,  $w_{ii} = 0$ , and  $w_{ij} = w_{ji} \ orall (i,j)$
- ullet The diagonal matrix  $D=diag(d_i)$  with  $d_i=\sum_{j
  eq i}w_{ij}$
- $\triangleright$  Corresponding graph Laplacean of G is:

$$L = D - W$$

lacksquare Gershgorin's theorem ightarrow L is positive semidefinite

18-49 \_\_\_\_\_ Csci 8314 – April 24, 20

# Graph Laplaceans: Another viewpoint

- ightharpoonup Let N be the incidence matrix:  $N_{ij}=\pm 1$  if i-th edge is incident on the j-th vertex.
- For example:  $A \leftrightarrow C,D$ ,  $B \leftrightarrow D$ ,  $C \leftrightarrow A$ ,  $D \leftrightarrow A,B$  (undirected graph):

$$N = egin{bmatrix} 1 & 0 & -1 & 0 \ 1 & 0 & 0 & -1 \ 0 & -1 & 0 & 1 \end{bmatrix},$$

yielding Laplacian = diagonal matrix of degrees — Adjacency matrix

$$N^TN = L = egin{bmatrix} 2 & 0 & -1 & -1 \ 0 & 1 & 0 & -1 \ -1 & 0 & 1 & 0 \ -1 & -1 & 0 & 2 \end{bmatrix}.$$

60 \_\_\_\_\_\_ Csci 8314 – April 24, 2014

# $Spectral\ Graph\ Partitioning$

Consider simplest case:

$$w_{ij} = \left\{egin{array}{ll} 1 & ext{if } (i,j) \in E\&i 
eq j \ 0 & ext{else} \end{array}
ight. egin{array}{ll} E\&i 
eq j \ D = ext{diag} \left[ d_i = \sum_{j 
eq i} w_{ij} 
ight] \end{array}$$

**Property:** (Graph partitioning) Consider situation when  $w_{ij} \in \{0,1\}$ . If x is a vector of signs  $(\pm 1)$  then

$$x^ op Lx = 4 imes$$
 ('number of edge cuts') edge-cut = pair  $(i,j)$  with  $x_i 
eq x_j$ 

- ightharpoonup Consequence: Can be used for partitioning graphs, or 'clustering' [take  $p=sign(u_2)$ , where  $u_2=2$ nd smallest eigenvector..]
- lacksquare Would like to minimize (Lx,x) subject to  $x\in\{-1,1\}^n$  and  $e^Tx=0$  [balanced sets]
- ➤ WII solve a relaxed form of this problem

**Background:** Consider any symmetric (real) matrix A with eigenvalues  $\lambda_1 \leq \lambda_2 \leq \cdots \leq \lambda_n$  and eigenvectors  $u_1, \cdots, u_n$ 

Recall that: (Min reached for  $x = u_1$ )

$$\min_{x\in\mathbb{R}^n}rac{(Ax,x)}{(x,x)}=\lambda_1$$

In addition: (Min reached for  $x = u_2$ )

$$\min_{x\perp u_1}rac{(Ax,x)}{(x,x)}=\lambda_2$$

- ightharpoonup For a graph Laplacean  $u_1=e=$  vector of all ones and
- ightharpoonup ...vector  $u_2$  is called the Fiedler vector. It solves a relaxed form of the problem -

$$\min_{oldsymbol{x} \in \{-1,1\}^n;\; e^Tx=0} rac{(Lx,x)}{(x,x)} \quad o \quad \min_{oldsymbol{x} \in \mathbb{R}^n;\; e^Tx=0} rac{(Lx,x)}{(x,x)}$$

ightharpoonup Define  $v=u_2$  then lab=sign(v-med(v))

8-53 Csci 8314 – April 24, 2014

# Normalized Graph Cuts

Mark a partitioning of the vertices:  $n_- = 1, \ n_+ = 3$   $v = [1, 1, 1, -3]^T/\sqrt{3 \cdot 1} = [n_-, n_-, n_-, -n_+]^T/\sqrt{n_- n_+}.$ 

Then

$$rac{v^T L v}{v^T v} = |\mathsf{cut}| \cdot \left(rac{1}{n_-} + rac{1}{n_+}
ight)$$

and  $v^Te=0$ , where  $e=[1,1,1,1]^T=$  eigenvector of L.

 $\triangleright$  Approximately minimize this with an eigenvector of L:

-1.E-15 (.500000 .500000 .500000) ← 'null' vector .585786 (-.27059 .653281 -.65328 .270598) ← 'Fiedler'

2.00000 (.500000 -.50000 -.50000 .500000) vector

3.41421 (.653281 .270598 -.27059 -.65328)

3-54 \_\_\_\_\_\_ Csci 8314 – April 24, 2014

### The Level Set Expansion Algorithm

➤ Given: **p** nodes 'uniformly' spread in the graph (roughly same distance from one another).

Do a level-set traversal from each node simultaneously.

Best described for an example on a 15 imes 15 five – point Finite Difference grid.

➤ See [Goehring-Saad '94, See Cai-Saad '95]
